MERN STACK

DAY – 39

8 August 2026

PROJECT: PARKEASY - PARKING MANAGEMENT SYSTEM

ADMIN PROFILE MANAGEMENT

• The Admin Profile Management module is developed to allow administrators to view and update their account information.

• It enables administrators to edit profile details such as name and email address.

• The profile update process communicates with the backend using REST API.

Admin Profile API

PUT /update-admin/:id

• Updates administrator profile information in the database.

• Modifies administrator name and email details.

• Saves updated profile information permanently in MongoDB.

Working

1. The AdminProfile() component is created to manage administrator profile details.

2. The admin user ID is retrieved from localStorage after login.

3. Existing administrator details are loaded using the GET /user-dashboard/:id API.

4. Profile information is displayed inside a profile card interface.

5. Administrators can edit their name and email fields.

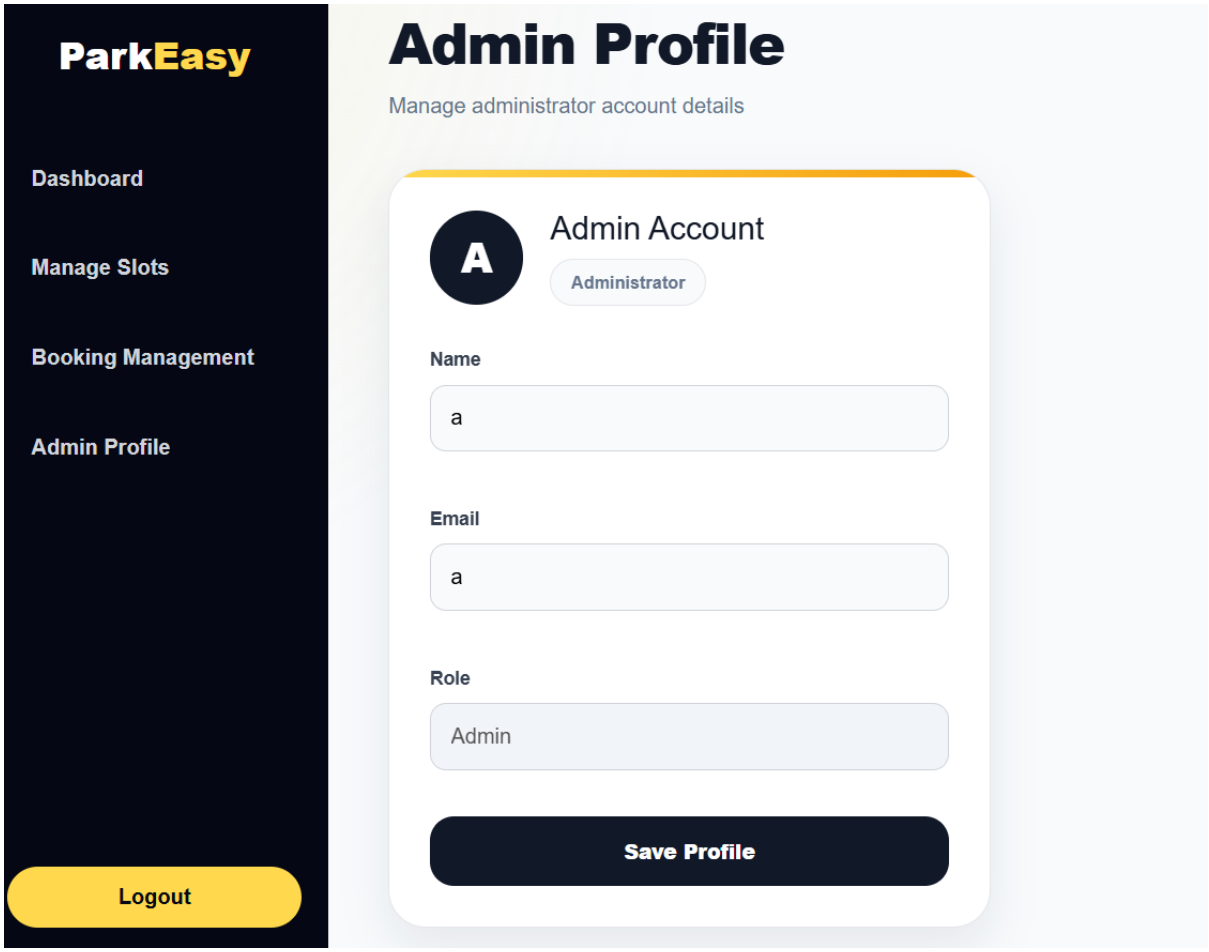

6. The Save Profile button sends updated information to the PUT /update-admin/:id API.

7. The backend verifies the administrator record before updating details.

8. Updated profile information is stored in MongoDB.

9. A success message is displayed after successful profile modification.

10. The Admin Profile Management module provides a simple and secure way for administrators to maintain their account information.
