MERN STACK

DAY – 28

27 July 2026

PROJECT: PARKEASY - PARKING MANAGEMENT SYSTEM

SIGNUP PAGE DEVELOPMENT

• The Signup Page is developed as a user registration module for the ParkEasy parking management system.

• It allows new users to create an account and register themselves into the application.

• The useState() hook is used to manage user input values and store registration details.

• The Signup Page collects the following user information:

1. Full Name
2. Email Address
3. Password
4. User Role

• The role selection allows users to register as:

1. User
2. Admin

• When the user clicks the Sign Up button, the handleSignup() function is executed.

• The entered user details are sent to the backend server using the Fetch API.

• The signup request is made using a POST method:

```
http://localhost:5000/signup
```

• User registration data is sent in JSON format:

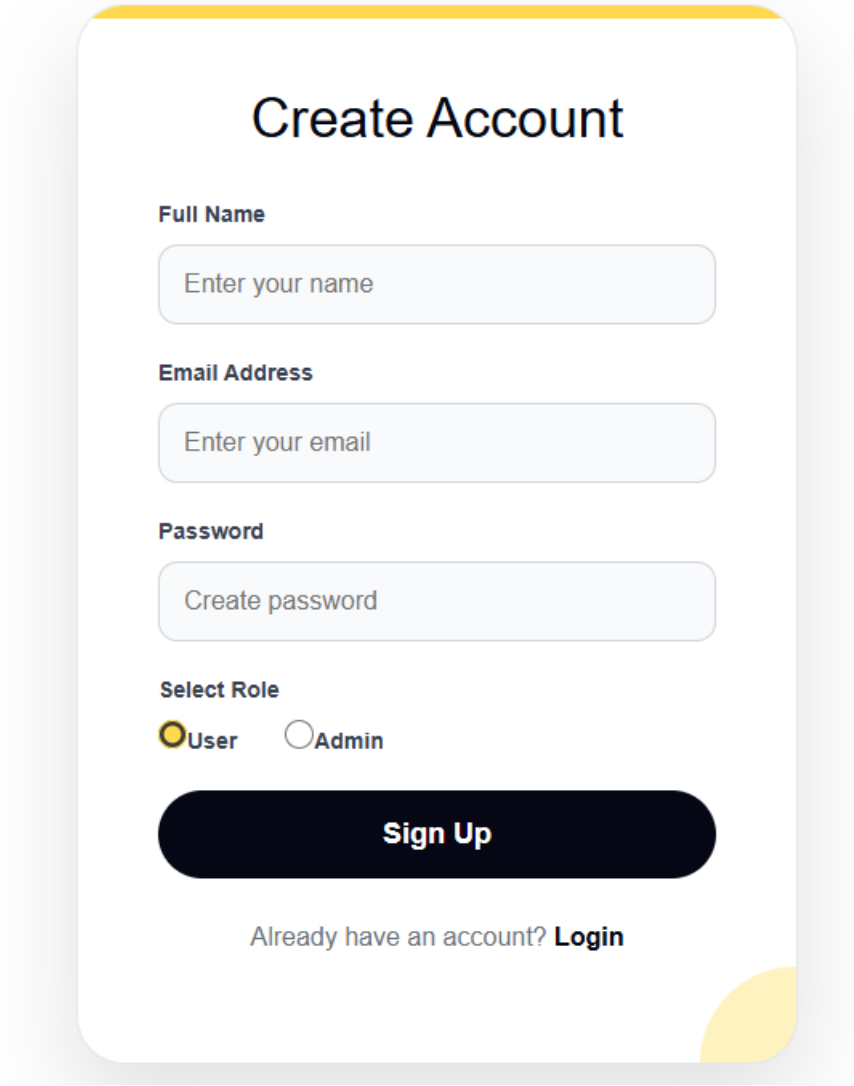

1. Name
2. Email

3. Password
4. Role

• The backend receives the registration request and stores the user information in the database.
• After successful registration, the form fields are cleared and the user is redirected to the Login Page.
• If registration fails, an error message is displayed to the user.

Working

1. The Signup form is created inside the Login() functional component to handle new user registration.
2. useState() is used to store user details such as name, email, password, and role.
3. The user enters registration details into the provided input fields.
4. The user selects a role using the radio button options.
5. When the Sign Up button is clicked, the handleSignup() function is executed.
6. The handleSignup() function sends user registration data to the backend using a POST request.
7. The backend processes the registration request and stores the user details in the database.
8. After successful account creation, the entered form data is reset.
9. The user is redirected to the Login Page for authentication.
10. If any error occurs during registration, the system displays an appropriate error message.
