DAY – 4

29 June 2026

CSS TYPES

Inline CSS

- Inline CSS is written directly inside an HTML element using the style attribute.
- It is used to apply styling to a single element only.
- It has the highest priority, so it overrides other CSS types.
- It is useful for quick testing or small changes, but not suitable for large projects because it is hard to maintain.

Internal CSS

- Internal CSS is written inside the HTML file within the head section using the style tag.
- It is used when styling is needed for only one webpage.
- It keeps structure (HTML) and design (CSS) in the same file but still separated logically.
- It is better organized than inline CSS but cannot be reused across multiple pages.

External CSS

- External CSS is written in a separate file with a .css extension and linked to HTML.
- It is used to style multiple webpages at once.
- It provides better organization and easier maintenance.
- It is the most professional and widely used method in real websites.

Box Model

The CSS Box Model explains how every HTML element is treated like a rectangular box. It helps control layout and spacing on a webpage.

It has four parts:

- Content: The main area where text, images, or other elements appear
- Padding: Space inside the box that surrounds the content
- Border: The visible outline around padding and content
- Margin: Space outside the box that separates it from other elements
