MERN STACK

DAY – 26

24 July 2026

PROJECT: PARKEASY - PARKING MANAGEMENT SYSTEM

HOME PAGE UI DEVELOPMENT

• The Home Page is the main interface of the ParkEasy smart parking management system.

• It is developed using React.js to provide users with an interactive and informative landing page.

• The page introduces the parking solution and explains how users can find, reserve, and manage parking spaces efficiently.

• React Router's useNavigate() hook is used to navigate users to the login page from different buttons.

• The Home Page consists of multiple sections including:

- Navigation Bar
- Hero Section
- About Us Section
- How It Works Section
- Features Section
- Footer Section

• The navigation bar provides quick access to different sections of the website such as About Us, How It Works, and Features.

• The Hero Section displays the main message of the application and provides a "Get Started" option for users.

• A parking dashboard is designed to show parking lot details and available parking slots.

• Parking slots are generated dynamically using an array:

```
const spaces = Array(24).fill("available");
```

• The map() function is used to create multiple parking slot elements dynamically.

• The About Us section describes the objective of ParkEasy and its role in improving traditional parking systems.

• The How It Works section explains the parking process in three simple steps:

- Find a Slot
- Reserve Space
- Park & Go

• The Features section displays important functionalities of the system:

- Easy Booking
- Smart Management
- Secure Parking

• CSS styling is applied to improve the appearance, layout, and user experience of the page.

Working

1. The Home() functional component is created to render the complete homepage of the ParkEasy application.
2. useNavigate() is imported from react-router-dom to handle navigation between pages.
3. Clicking the "Get Started" or "Start Now" button redirects the user to the login page using:

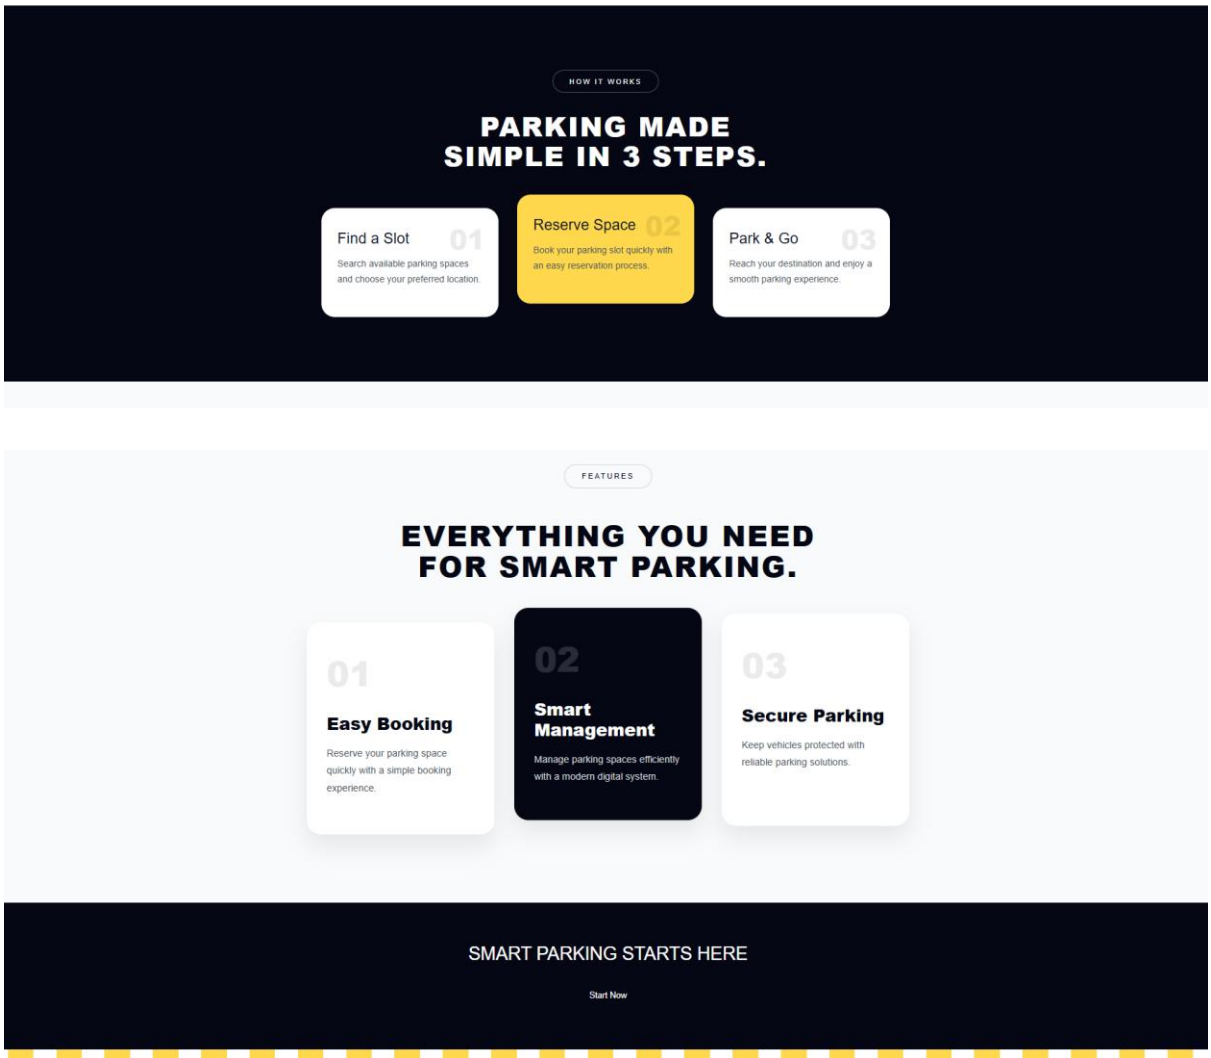

```
navigate("/login")
```

4. The hero section provides information about the smart parking system and encourages users to start using the application.
5. The parking dashboard displays available parking spaces by generating 24 parking slot components dynamically.

6. Different sections are separated into components using proper HTML structure and CSS classes for better maintainability.
7. The footer section provides an additional navigation option for users to access the login page.

The purpose of this Home Page is to provide users with a user-friendly interface for understanding the ParkEasy smart parking system, viewing parking availability, exploring features, and accessing the application through secure login.
