MERN STACK

DAY – 27

25 July 2026

PROJECT: PARKEASY - PARKING MANAGEMENT SYSTEM

LOGIN PAGE DEVELOPMENT

• The Login Page is developed as an authentication module for the ParkEasy parking management system.
• The useState() hook is used to manage input values and control the switching between Login and Signup forms.
• The useNavigate() hook from react-router-dom is used to navigate users to different pages after successful authentication.

• The Login Page contains two main sections:

1. Login Form
2. Signup Form

Login Form

• The Login Form allows existing users to enter their registered email and password.
• User credentials are sent to the backend using the Fetch API.
• The login request is made using a POST method:

```
http://localhost:5000/login
```

• The email and password entered by the user are sent in JSON format.
• After successful authentication, user details are stored in localStorage:

1. User Role
2. User Name
3. User ID

Working

1. The Login() functional component is created to handle user login functionality.
2. useState() is used to store email and password values entered by the user.
3. The user enters login credentials into the input fields.
4. When the Login button is clicked, the handleLogin() function is executed.
5. The handleLogin() function sends the entered email and password to the backend using a POST request.
6. The backend verifies the user credentials from the database.
7. If authentication is successful, user details are stored in localStorage.
8. The application checks the user role received from the server.
9. Based on the role, the user is navigated to the respective dashboard.
10. If authentication fails, the system displays an appropriate error message.
